Today, AutoCAD is the world's leading CAD software and is used by engineers, architects, product designers, and other technical professionals. Many notable landmarks around the world were designed using AutoCAD, including the Petronas Towers, The Golden Gate Bridge, and the Shard of Glass, and at least 1.2 million users now use AutoCAD. AutoCAD is used for architectural design, architectural drafting, 3D design, and mechanical and civil engineering. It is also used in a wide variety of commercial products. The AutoCAD User's Guide, originally published in 1986, is the starting point for most AutoCAD instruction. Other useful resources include the Product Support, Knowledge Base, online articles, forums, blogs, and training videos. What is AutoCAD? AutoCAD is a CAD software application that allows users to create and edit 2D and 3D drawings, as well as build databases and models. AutoCAD was first created by Eliot Brown at Rand in 1971. Because AutoCAD was running at a time when most CAD programs ran on mainframe computers, it was necessary to provide each user at a graphics terminal with a separate image and data source (e.g., paper, image, model) to work with. A user would select a layout on the graphics screen, and then enter commands and edit, annotate, or modify the drawing using a graphical interface, with the changes automatically updated to the screen image. AutoCAD 1982 AutoCAD was introduced in December 1982 as a desktop application, and its first version was renamed AutoCAD, for AutoCADning, Automatic Computer-Aided Drafting. AutoCAD was an early desktop CAD program (computer-assisted drafting) and marked the beginning of Autodesk as a company devoted to the development of CAD software. AutoCAD was first introduced at the Computerworld InterOP '82 show, where it was marketed by the newly created Rand Corporation, later to become Autodesk. In addition to drafting, AutoCAD has since added functions to support 2D and 3D computer-aided design (CAD) drawing and drafting. AutoCAD 2012 also includes feature-rich tools to create 2D and 3D maps for transportation and facility planning. Business Application Programming Interface (BAPI), which is built using C++, supports the development of applications that work in conjunction with AutoCAD. The graphical user interface is modeled after Excel. AutoCAD also allows scripts to be written in the scripting language AutoLISP, which is a variant of the Lisp programming language. For interactive use, this enables users to control AutoCAD from inside another program, without having to launch AutoCAD. AutoLISP is one of the earliest commercially available object-oriented programming languages for Windows and is still used today. AutoCAD ships with two versions of AutoLISP: AutoLISP Basic and AutoLISP Professional. While AutoLISP Basic is shipped as a built-in component of AutoCAD, AutoLISP Professional is available for separate purchase and use in stand-alone applications. Unlike a few other object-oriented programming languages, AutoLISP does not support object-oriented development. AutoLISP can be used with a number of applications including Microstation, PowerCADD, PDM, Design Review and BIM 360. It has 2 separate layers (angular 2 and spring boot). When I have my service in the application.js like below, it works fine: import { getNavigationState } from './di/service'; @Injectable() export class MyService { private navigationState: NavigationState = null; getNavigationState(): return this.navigationState; } } However, when I move this service to a separate.is file, getNavigationState() does not work properly, it does not contain any information about the current page. How can I make getNavigationState() work properly in a separate service file? A: First I figured that the only way to get this working is to explicitly put the navigationState class in the export. export class MyService { private navigationState: NavigationState = null; getNavigationState(): return this.navigationState; } } When this approach did not work, I figured out that the module system does not load the class NavigationState because it is not in the export section. The solution for this was to import the NavigationState class and make it public and then use it like so: import { NavigationState } from './shared/services/NavigationState'; export class MyService { private navigationState: NavigationState = null; getNavigationState(): return this.navigationState
