This change is visible in the shift from the portrayal of Asian characters as sidekicks or servants to their emergence as leading heroes. In comics, this movement began during the 1980s with the launch of TV's The Incredible Hulk and its introduction of a new type of Asian hero -- Dr. Bruce Banner. In the late 1980s, the groundbreaking Spider-Man introduced the first nonwhite Spider-Man, Danny Kincaid. In the 1990s, the anime-influenced Dragon Ball, which became a massive hit in the US, introduced a new wave of Asian superheroes. Goku, the hero's name was literally inspired by the Chinese character for "to battle." With the new wave, the idea of Asian superheroes was not a novelty anymore. The new wave of Asian superheroes experienced a surge in popularity thanks to the release of the 1999 hit, Blade, which featured the only Asian (Korean) actor Nicolas Cage in a leading role. The newly released 2000s saw a new wave of Asians portrayed as heroes, including Sean Park as G.I. Joe in 2004. In 2007, the highest-grossing film (big budget sci-fi action movie) Man of Tai Chi introduced the first Asian American Hulk, played by Tony Leung. Comic book superheroes often share a common theme: a desire for fame and fortune at the cost of others, sometimes in violent ways. This simple plotline belies the dramatic complexity the Asian superheroes have been able to provide to the American cultural landscape and has been shown to shed light on the political, sociological, and historical contexts in which Asian American characters appear. In the ongoing debate about which superhero is the best of all time, it's fascinating to see that in each phase of the depiction of Asian superheroes, there has been an underlying concern with the power of the nation and the American identity. In the 1970s, a representative of the ideal version of the American nation was the tough antihero, and Asian characters were there to

Determining the optimal time of implantation of orthopedic devices in the splint arthroplasty algorithm. The spacial anatomy of a rotator cuff tear is frequently a factor in the decision to perform a Bankart repair or a Bristow-Latarjet procedure. Confirming the appropriate timing of orthopedic device placement and the need for a second surgery post-op, such as a rotator cuff repair or debridement, may preclude the need for a second surgery as was described in previous strategies. A retrospective review was conducted of all cadaveric glenohumeral joints that underwent Bristow-Latarjet ($n = 50$) and Bankart ($n = 50$) procedure. Wear guides were used to examine the supra- and subacromion wear patterns at the time of implantation of the orthopedic devices. Wear of the supra- and subacromion was found to occur within the first two years post-op. A wear rate of the supra-acromion of 4.17 mm/year and the subacromion of 3.74 mm/year was identified. Implantation of the orthopedic devices at the time of surgery had no effect on either the glenoid or the humeral head wear pattern. The wear rate of the subacromion was at least four times greater than the wear rate of the supra-acromion. The wear rate of both the supra- and subacromion should be considered when determining the optimal time for orthopedic device implantation. The supra-acromion wear rate is small in this cadaveric study. Therefore, and considering the risks of re-tearing the rotator cuff or of arthritis developing after continued use of the orthopedic device, it is reasonable to consider the orthopedic device to be implanted at the time of the initial surgery. However, the wear rate of the subacromion is at least four times greater than the wear rate of the supra-acromion. Given these findings, implantation of the orthopedic device after the second surgery may be justified, depending on the patient. $+ 2 * x ** 5 +$
