Nucleotide protein annotation from the National Center for Biotechnology Information (NCBI). Caution - Contains only protein-coding regions, including introns, and is missing the non-coding regions, including intergenic and UTR regions. CXX, FXX, DDX, SXX, and other numeric-denoting bases are interpreted as numbers of amino acids encoded by the codon, for example, an FXX codon encodes a protein of length 55. An AUX base is used in some proteins of some species, most notably, the E. coli protein NusA. In all other species, AUX is used to specify the third nucleotide of the codon. . In general, the propagation channel changes in time according to the movements of a communication terminal and a base station. The base station learns the change in the propagation channel through feedback and transmits a signal according to the learned change in channel status. The wireless communication system has high channel fluctuation depending on the movements of a communication terminal and a base station or may have severe interference between a plurality of base stations. Accordingly, in
