I have tried the below code but it doesn't seem to work. Could anyone help me on this please. private void grid_SelectionChanged(object sender, EventArgs e) { if (grid.SelectedRows.Count > 0) { var selectedDate = grid.SelectedRows[0].Cells[0].Value.ToString(); } } A: Are you sure that the DataGridView has the DateTime property at all? It can be a DataGridViewTextBoxColumn, DateTimePicker or ComboBox etc. In this case if you have the value as string you can use it like this: var selectedDate = grid.SelectedRows[0].Cells[0].Value.ToString(); if (selectedDate!= "") { var selectedDate = grid.SelectedRows[0].Cells[0].Value.ToString("dddd, MMMM d, yyyy"); } Thomas Willis Jackson Thomas Willis Jackson (June 16, 1848 – March 23, 1935) was an American minister, and author of The Standard Handbook for Librarians. Each year, millions of tons of plastic pollution reaches the world's oceans and, because it is so durable, it has a huge influence on the planet. Some of it floats on the surface of the water. Much of it, however, sinks and ends up in the deep ocean where it may never be seen again. Scientists refer to this, like everything else in the ocean, as "the great gyre." We've all seen the swirl of plastic trash in the ocean, sometimes appearing in huge, vortex-like formations. It's one of the most recognizable images of our planet. And in some parts of the world, it's worse than you'd imagine. The Pacific Gyre is one of the largest vortices in the world, swirling at approximately 200 miles per hour. It's twice as wide as the continental United States, extending from Japan all the way down to the US, and scientists think it's where more than half of the plastic waste in the ocean ends up. It's easy to imagine that it's just one big blob of trash, but the thing that makes this particular vortex unique is that it's actually alive. This giant mass of swirling ocean is actually, in the words of British oceanographer Kevin Milot, "a super-rotating cyclonic eddy with a very hot and salty interior." It's part of a system of gyres, the same system that makes up the rest of the planet. "These big loops, they have really strong currents going around," says Milot, a professor at University College London. "And they're like giant whirlpools, so you can get things on them and inside them." Now, if that's not already terrifying, Milot and a team of researchers have found something new about the Pacific Gyre that may be even more disconcerting: a huge amount of tiny, plastic particles inside the gyre. "It's not even close to the biggest one," Milot says, referring to the
