\ã-ÂòÝEi What i need is for that output to be  
in an array and then i need to check if the  
letter is the same. For example \$letter = "x";  
if (in\_array(\$letter, \$letters)) { print\_r("its a  
match"); } else { print\_r("not a match"); }  
basically for every letter i need to be able to  
check if it is in the array of letters. A: If you  
are simply after an array of matching  
strings, use array\_intersect like so: \$matches  
= array\_intersect(\$letters,  
array\_map('strtolower', \$letters));  
array\_intersect will return an array

---

containing all of the matching elements. If you have no need to preserve or count the values, you can just loop through the array and perform the strtolower. If you need to preserve the count, use array\_count\_values can't do anything else unless I'm already looking through an interface. You can't click on any of the icons on a locked iPad unless you unlock it. You can't unlock it. No one knows what they're talking about. They have no idea what they're talking about. I can install whatever I want, and as long as I'm not running an app
